Sales of summer clothes in E-commerce Wish

Content

The data comes from the Wish platform and contains product listings as well as product ratings and sales performance.

The products listed in the dataset are those that would appear if you type "summer" in the search field of the platform.

You can browse the Wish website or app to get a feel of the type of information you can get from there and how they are presented. This might give you some ideas and a better understanding.

If you are confused about some columns, you can either look at the column descriptions, browse the Wish website/app, or try to find answers in online forums.

The image is a screenshot of the Wish app's search results for the term "summer". It features a grid of product listings, each with a thumbnail image, a price, and a discount percentage. Annotations with arrows point to specific elements on the screen to explain how they map to data columns in the dataset:

- price column:** Points to the price displayed below each product image (e.g., €6, €16, €8, €7).
- retail_price column:** Points to the original price (e.g., €40, €44, €17) shown next to the discounted price.
- product_picture column:** Points to the square thumbnail image of the product.
- urgency_text column:** Points to text like "Almost Gone!" or "Wish Select" that creates a sense of urgency.
- units_sold column:** Points to the text "20,000+ bought this" or "50+ bought this", which is converted to an integer in the dataset.
- uses_ad_boosts column:** Points to a small "ad" icon in the bottom right corner of some product listings.
- Sections, not product categories:** Points to the "Top Features" sidebar on the left, which includes filters like "Popular", "Express", "Local", etc.
- Search results:** Points to the search bar at the top containing the text "summer".
- Related search terms:** Points to the category suggestions at the top, such as "summer dresses for women", "pool", "summer clothes for women", etc.

All in all, we see that the website actually does not have the concept of categories. Rather, it uses tags (keywords/compound keywords) sellers can set. When the keyword is searched for (like "summer"), products related to that tag appear.

Column's description

1. title – title for localized for European countries. It May be the same as title_orig if the seller did not offer a translation
2. title_orig – original English title of the product
3. price– the price you would pay to get the product
4. retail_price – reference price for similar articles on the market, or in other stores/places. Used by the seller to indicate a regular value
5. currency_buyer – the currency of the prices
6. units_sold – the number of products sold during the whole "lifespan" of the product listing.
7. uses_ad_boosts – whether the seller paid to boost his product within the platform (highlighting, better placement, or whatever).
0=No boost, 1=boosts.
8. rating – mean product rating
9. rating_count – total number of ratings of the product
